FOR SMALL & MICRO BUSINESSES
INDIVIDUAL REPORT.**

Full Name	Kieu Xuan Thuy
Student ID	2311380703
Course:	NHA408E(2526-2)GD2.01
Class:	CTTTTC - K62
Lecturer:	Phan Tran Trung Dzong, Assoc. Prof., Dr.
Group	2
Role	UX/UI Designer
Project Website	PixiuFlow

1. ROLE IN THE PROJECT

In the PixiuFlow project, I took on the role of UX/UI Designer, with primary responsibility for user experience research, product flow design, interface design, and maintaining design system consistency across the entire platform. Beyond visual design, my responsibilities extended across the full product-thinking lifecycle:

- ▶ Analyzing and translating user requirements into actionable design decisions (Based on the sitemap conducted by other members who are responsible for
- ▶ Designing User Flows that map every step a user takes across core features
- ▶ Creating Wireframes and high-fidelity Prototypes to communicate design intent
- ▶ Standardizing the user experience across all major system modules
- ▶ Collaborating with other designer to ensure visual and interaction consistency

My scope covered the first half of the design workload, from initial research and structural planning (with the whole group) through wireframing and component system setup before handing off to the member who took the responsibility for front-end development to implement the remaining screens into code

2. PERSONAL IMPACT ON THE PRODUCT

My most significant contribution was designing and refining the user experience for PixiuFlow's operational and analytical modules, covering features from bulk transaction recording to advanced business analysis. I was responsible for creating interfaces that help users efficiently manage large volumes of financial data, monitor business performance, and gain actionable insights from their operations.

The goal of my work was not only to make data entry faster and more convenient, but also to ensure that users could easily interpret financial information and make informed business decisions. Through these modules, users are able to record multiple transactions at once, manage products and inventory, review transaction history, track key financial indicators, and access deeper analytical reports that support business planning and performance evaluation.

The primary design challenge I addressed was translating complex financial and operational information into interfaces that remain intuitive for small and micro-business owners, many of whom have limited experience with accounting software or financial analysis tools. Throughout the design process, I continuously evaluated whether users could quickly understand the information presented, complete tasks efficiently, and navigate between operational and analytical functions without confusion. Several key design principles guided my work:

- ▶ **Simplicity before complexity:** Present essential information first while allowing users to access more detailed insights when needed.
- ▶ **Visual clarity:** Use charts, financial summaries, color indicators, and whitespace to make information easier to understand.
- ▶ **Consistency:** Maintain a unified design language and interaction pattern across transaction management, inventory management, and analytical modules.
- ▶ **Goal-oriented design:** Structure screens around business tasks and decision-making processes rather than technical system functions.

3. ACTUAL TASK COMPLETION

Task 1: User Research & Feature Planning

This phase was conducted collaboratively with the team before the design process began. Together, we identified the operational and financial management needs of small and micro-business owners and translated those requirements into system features.

- ▶ **Researched common challenges faced by small businesses in managing daily operations**
 - Identified difficulties in tracking revenue, expenses, inventory levels, and business performance using spreadsheets or manual records
 - Recognized the need for a centralized platform that combines transaction management and financial analysis
- ▶ **Participated in defining key system features**
 - Transaction recording and bulk transaction recording
 - Transaction history management
 - Product and inventory management
 - Financial performance tracking
 - Business analytics and reporting
- ▶ **Contributed to sitemap and feature structure discussions**
 - Helped determine the relationships between operational modules and analytical modules
 - Ensured that users could move smoothly from recording transactions to reviewing business insights

Task 2: Interface Planning & Design Direction

Before designing the assigned screens, I conducted visual research and explored interface patterns commonly used in financial and business management platforms.

► Benchmarked relevant products and dashboards

- Analyzed inventory management and accounting systems to understand common workflows
- Studied dashboard layouts and financial reporting interfaces for data presentation ideas
- Reviewed SaaS platforms that simplify complex business information for non-technical users

► Established design principles for assigned modules

- Prioritized usability and efficiency for repetitive business tasks
- Designed interfaces that reduce data-entry effort while maintaining clarity
- Maintained consistency with the overall PixiuFlow design system

► Applied the project's visual language

- Used the established color system, typography, and component library
- Ensured consistency across transaction management, inventory management, and analytics screens

Task 3: Interface Design & UX Implementation

I was responsible for designing the operational and analytical modules of PixiuFlow, covering screens from bulk transaction recording to advanced business analysis.

► Designed the Bulk Transaction Recording interface

- Created a structured table layout for entering multiple transactions efficiently
- Added category selection, validation states, and summary calculations
- Reduced repetitive manual input for business owners handling large transaction volumes

► Designed the Transaction Recording screens

- Built intuitive forms for revenue and expense recording
- Organized transaction details into clear sections to improve data-entry efficiency
- Included real-time financial summaries to provide immediate feedback

► Designed the Transaction History module

- Created searchable and filterable transaction records
- Designed summary cards displaying key financial indicators
- Improved visibility of past business activities and financial performance

► Designed the Product & Inventory Management module

- Developed inventory overview tables displaying stock levels, product information, and performance metrics
- Added visual indicators for inventory status and stock monitoring
- Structured information to support faster inventory tracking and decision-making

► Designed the Advanced Analytics module

- Created dashboards displaying financial trends, profitability indicators, and operational metrics
- Designed data visualization components including charts, KPI cards, and summary panels
- Enabled users to monitor business performance and identify key business insights more effectively

► Collaborated with team members to maintain design consistency

- Followed the shared design system and component library
- Participated in design reviews and iterative improvements throughout the project

Task 4: Prototyping and Design Handoff

After completing the interface designs, I developed interactive prototypes and prepared design assets for implementation. My focus was ensuring that operational workflows and analytical features could be demonstrated clearly and handed over efficiently.

► **Built interactive prototypes in Figma covering key user workflows**

- Record a single transaction → categorize revenue/expense → review financial summary
- Record multiple transactions → validate entries → update financial records
- Manage products and inventory → monitor stock levels → review inventory performance
- Navigate from transaction history and inventory modules to advanced analytics dashboards

► **Refined designs based on team discussions and feedback**

- Improved table layouts to accommodate large amounts of transactional data
- Adjusted information hierarchy to make key financial metrics more visible
- Simplified navigation between operational and analytical modules to reduce user effort

► **Standardized designs for developer handoff**

- Annotated key screens with spacing specifications, color tokens, and component usage guidelines
- Organized Figma pages, layers, and components for easier implementation
- Ensured consistency with the shared design system across all assigned screens

► **Supported prototype demonstration and product presentation**

- Connected screens through interactive navigation flows
- Prepared realistic user journeys for project demonstrations and testing
- Verified that major business workflows could be completed smoothly within the prototype

4. FILES, FEATURES & CONTRIBUTIONS

Deliverable	Description
Wireframes	Low-fidelity wireframes for all assigned screens, including Transaction Recording, Bulk Transaction Recording, Transaction History, Product & Inventory Management, and Advanced Analytics modules.
UI Component Library	Shared Figma component library including buttons, form fields, tables, KPI cards, charts, filters, navigation elements, and status indicators used across operational and analytical screens.
Transaction Recording	Revenue and expense recording interface with categorized transaction inputs, real-time financial summaries, and validation states to support accurate data entry.

Deliverable	Description
Bulk Transaction Recording	Structured table-based interface allowing users to record multiple transactions simultaneously, reducing repetitive manual input and improving operational efficiency.
Transaction History	Searchable and filterable transaction management screen with summary KPI cards, transaction details, status tracking, and historical financial records.
Product & Inventory Management	Inventory dashboard displaying stock levels, product information, inventory value, stock alerts, and product performance metrics to support inventory monitoring and decision-making.
Advanced Analytics Dashboard	Business performance dashboard featuring KPI summaries, profitability indicators, revenue and expense trends, inventory insights, and visual analytics to support strategic decision-making.
Interactive Prototype	Figma prototype connecting all assigned modules into complete workflows, including transaction recording, bulk transaction entry, inventory management, transaction tracking, and business analytics navigation.

5. EVIDENCE OF CONTRIBUTION

► Figma project file

Image 1: Overall Widget of Figma

► Figma edit history

Starting point on May 4

Finishing final version around 20 May

5. EVIDENCE OF CONTRIBUTION

► Screenshots of design versions across the iteration lifecycle

First Idea Brainstorm and Color scheme from 2 UI/UX designers

This screenshot shows the 'Ghi nhận giao dịch' (Record Transaction) form in the PIXIU FLOW application. The form is designed for recording business transactions and includes fields for 'Doanh thu mới' (New Revenue) and 'Chi phí mới' (New Expense). It also features a 'TÊN SẢN PHẨM' (Product Name) field with a dropdown menu, a 'ĐƠN VỊ' (Unit) field, and a 'Số lượng hàng hóa' (Quantity of Goods) field. The form includes a 'Ghi nhận' (Record) button and a 'Lưu sản phẩm' (Save Product) button. The right sidebar shows a summary of the transaction with 'Lợi nhuận hôm nay' (Today's Profit) at 32,350,000 VND, 'Tổng chi phí hôm nay' (Today's Total Expense) at 12,850,000 VND, and 'Tổng doanh thu hôm nay' (Today's Total Revenue) at 45,200,000 VND.

This screenshot shows the 'Lịch sử giao dịch' (Transaction History) table in the PIXIU FLOW application. The table displays a list of transactions with columns for 'Loại' (Type), 'Ngày' (Date), 'Nội dung' (Content), 'Đơn vị' (Unit), 'Số lượng' (Quantity), 'Số tiền nhập' (Input Amount), and 'Số tiền xuất' (Output Amount). The table includes a search bar and a filter dropdown. The data rows show various transactions, including 'Doanh thu' (Revenue) and 'Chi phí' (Expense) entries, with their respective dates, amounts, and units.

Loại	Ngày	Nội dung	Đơn vị	Số lượng	Số tiền nhập	Số tiền xuất
Doanh thu	25/04/2025	Miền	lít	50	+300,000 đ	
Chi phí	25/04/2025	Miền	lít	50		-300,000 đ
Doanh thu	19/04/2025	Miền	lít	5	+35,000 đ	
Doanh thu	19/04/2025	Miền	lít	10	+80,000 đ	
Chi phí	19/04/2025	Miền	lít	5		-20,000 đ
Chi phí	19/04/2025	Miền	lít	14		-81,988 đ

6. HOW MY CONTRIBUTION CONNECTS TO THE FINAL PRODUCT

My contribution forms an important part of PixiuFlow's operational and analytical workflow. The modules I designed are the areas where users spend most of their time managing day-to-day business activities and reviewing business performance.

The interfaces I designed, including Transaction Recording, Bulk Transaction Recording, Transaction History, Product & Inventory Management, and Advanced Analytics, help transform raw business data into meaningful information that users can act upon. These modules allow business owners not only to record financial activities efficiently but also to monitor inventory, evaluate performance, and identify trends that support decision-making.

By designing consistent workflows, clear data structures, and intuitive visualizations, I helped bridge the gap between operational management and business analysis. My work contributes directly to the platform's usability, making financial information more accessible to small and micro-business owners who may not have formal accounting knowledge.

The final product reflects a connected user journey, where information entered through transaction and inventory modules flows naturally into dashboards and analytical reports, allowing users to move seamlessly from recording data to understanding their business performance.

7. PERSONAL LESSONS

This project provided me with practical experience in designing data-intensive business management systems rather than simple informational websites.

Key lessons I learned include:

- ▶ How to transform complex financial and operational requirements into interfaces that remain understandable for non-expert users.
- ▶ How to design large-scale data management screens, including tables, filters, search functions, and inventory tracking systems.
- ▶ The importance of information hierarchy when presenting large amounts of business data.
- ▶ How effective data visualization can improve decision-making by helping users quickly identify patterns and performance trends.
- ▶ How to balance usability and functionality when designing systems that require users to perform repetitive tasks efficiently.
- ▶ How to collaborate with other team members throughout the design process while maintaining consistency across multiple modules.

8. CHALLENGES AND SOLUTIONS

Challenge 1: Designing interfaces for large volumes of transactional data

Many of the screens I designed required users to manage dozens or even hundreds of transactions and inventory records. Presenting this information clearly without overwhelming users was one of the main design challenges.

How I resolved it:

- ▶ Organized information using tables, filters, search functions, and summary cards.
- ▶ Prioritized important information through visual hierarchy and spacing.
- ▶ Added quick-access actions to reduce the number of steps required to complete common tasks.
- ▶ Used consistent layouts across similar screens to reduce the learning curve.

Challenge 2: Presenting analytical information in a user-friendly way

The analytics module contains financial indicators, performance metrics, and business insights that may be difficult for non-technical users to interpret.

How I resolved it:

- ▶ Used charts, KPI cards, and visual indicators instead of relying solely on numerical tables.
- ▶ Highlighted important metrics through color coding and summary sections.
- ▶ Structured dashboards to provide both high-level overviews and more detailed information.
- ▶ Focused on helping users quickly identify trends and business performance without requiring accounting expertise.

9. ADVICE FOR FUTURE STUDENTS

One of the most important lessons I would share with future students is to begin with understanding the problem and the users before opening any design tool. It is tempting to start creating screens immediately, but spending time understanding how users work, what difficulties they face, and what goals they want to achieve will make the design process much more effective. A good interface is not created by visual creativity alone; it comes from solving real user problems.

Another recommendation is to focus on information architecture and workflow design before moving to visual design. In business management systems such as PixiuFlow, users interact with large amounts of financial and operational data every day. If the navigation structure, page hierarchy, or user flow is not planned carefully from the beginning, the system can quickly become confusing. Creating a clear sitemap and defining user journeys early can prevent significant redesign work later in the project.

Students should also invest time in building reusable components and establishing design standards as early as possible. A well-organized component library helps maintain consistency across screens, speeds up the design process, and makes collaboration much smoother when multiple designers are involved. Even for relatively small projects, a structured design system can save a considerable amount of time and reduce unnecessary inconsistencies.

When designing business applications, it is important to prioritize usability and efficiency over visual decoration. Users visit these systems to complete tasks, manage information, and make decisions. Therefore, designers should focus on helping users perform actions quickly and understand information easily. Visual elements should support functionality rather than distract from it.

In addition, students should continuously test their designs and gather feedback throughout the development process. Many design decisions that appear effective from a designer's perspective may not be immediately clear to actual users. Receiving feedback from teammates or potential users can reveal usability issues early and help improve the overall quality of the product.

Finally, students should understand that design is an iterative process. Rarely does the first version become the final version. Throughout this project, many screens were revised multiple times as new requirements emerged and feedback was collected. Being open to revision, learning from mistakes, and continuously improving the design are essential habits for creating a successful product.
